For instance, the dissociation of a normal solution of acetic acid is 0.4 , but this is reduced to 0.0018 if a gram equivalent of sodium acetate is added to the solution. Since the strength of the acid, or the intensity with which it takes part in reactions or accelerates them (cf. the inversion of sugar, p. 98) is determined by the concentration of the H ions, it is evident that acetic acid is very much weakened by the addition of CHCOONa. The same is true of other acids and bases. For instance, the precipitation of ZnS by H₂S is prevented by the addition of acid, for the H-ions of the acid cause a great decrease in the dissociation of the H₂S with a consequent decrease in the number of S ions. For the same reasons the precipitation of Mg(OH)₂ by NH₄OH is prevented by the previous addition of ammonium salts. The forcing back of the dissociation is also of great importance in all reactions of precipitation. If we wish to precipitate Ag ions by Cl ions and add an amount of chlorine which is exactly equivalent to the silver, then a quantity of silver corresponding to the solubility of AgCl remains in solution. This is 0.000011 mol., i.e., a saturated solution of AgCl contains 0.000011 X 108 = 1.2 mgr. of silver. In washing a silver-chloride precipitate an appreciable error might be introduced owing to the solubility of the precipitate. The law of mass action...
